

UX/UI Case Study: High-Stakes Driving Practice Redesign

A structured behavioral and cognitive breakdown of the **Kursify** driving practice platform (*Sõidupraktika juhendajaga*), synthesized using three behavioral frameworks: **The Spectrum of Thinking Interventions**, **BJ Fogg’s Behavior Model** ($B = MAP$), and the **CREATE Action Funnel**.

1. Project Context & Behavioral Risk Profile

Booking an official driving practice mentor under Estonian Traffic Law (§ 109 Liiklusseadus) is not an impulse purchase. It carries distinct cognitive and physical risks:

- Financial & Test Stakes:** Students face failure anxiety regarding the State Transport Administration (*Transpordiamet / ARK*) exam and fear paying for wasted hours.
- Safety & Regulatory Friction:** Driving without dual pedals (*lisapedaalid*) or an active instructor certificate (*T-kaart*) poses genuine road safety and legal liability risks.
- The Legacy Failure:** The baseline UI treated driving lesson reservation as a friction-free e-commerce action, hiding critical legal disclaimers, lacking social proof, and burying instructor schedules.

2. Theoretical Breakdown

Framework 1: Spectrum of Thinking Interventions (System 1 vs. System 2)

The legacy layout presented a single binary trigger (*Broneeri sõit*) directly on the card without adequate inspection capability.

- The Issue:** It forced a high-stakes, analytical choice (*System 2*) into an impulsive click pattern (*System 1*) while downplaying critical hazards (e.g., student-owned car vs. dual pedals) as passive tags.
- The Solution:** We introduced **deliberate cognitive friction**:

- A split-path card CTA pairing **Profiil** (analytical evaluation) with **Broneeri sõit** (actionable booking).
- High-visibility safety badges indicating certified pedal mechanics (**Lisapedaalidega** vs. **Õppuri autoga**).
- Explicit legal gates: an interactive information banner explaining *T-kaart* requirements, backed by an inline checkbox in the booking modal requiring users to confirm valid certification before committing.

Framework 2: BJ Fogg Behavior Model ($B = MAP$)

Target behavior occurs when **Motivation**, **Ability**, and a **Prompt** converge at the same moment.

- **Motivation (M):**
 - *Legacy*: Flat ratings, missing review counts, and absent exam performance metrics created severe trust deficits.
 - *Redesign*: Introduced quantitative social proof: exact star rating and review totals (e.g., **★ 4.95** (68 hinnangut)), years behind the wheel, and verified first-attempt pass rates (**88% esimesel katsel**).
- **Ability (A):**
 - *Legacy*: High time-friction. Users had to guess availability and did not know whether sessions were standard school hours (45 min) or full hours.
 - *Redesign*: Surfaced transparent timeframes directly on the card: **Vaba aeg: Homme 16:00** and clear pricing structure (**25 € / h** , explicitly labeled as a **60 min sõit**).
- **Prompt / Trigger (P):**
 - *Legacy*: Low-contrast, conflicting button weights.
 - *Redesign*: Unified two-step checkout modal with preset meeting points (e.g., *Mäepepe 19 Transpordiamet, Mustika Keskus*) and zero-upfront-payment reassurance ("*Tasumine kohapeal*").

Framework 3: CREATE Action Funnel

Mapping the user journey stage-by-stage to eliminate drop-off:

[1. Cue]	————>	[2. Reaction]	——>	[3. Evaluation]	->	[4. Ability]	—>	[5. Timing]	————>	[6. Execution]
Interactive T-kaart header & clear scope		"Tunnistus olemas" badge kills illegality		Pass rates, reviews, and dual-pedal tags		Transparent meeting points & zero deposit		"Vaba aeg: Homme 16:00" healthy urgency		2-step modal, zero upfront payment

- **1. Cue:** Interactive top-strip banner explains statutory compliance (§ 109) with an expandable tooltip ("*Mis on T-kaart?*"), eliminating banner blindness.
- **2. Reaction:** The prominent green badge **✓ Tunnistus olemas** addresses the instinctual fear of unlicensed coaching.
- **3. Evaluation:** Structured comparison chips for transmission (**Aut / Man**), spoken languages, and state exam success rates allow rapid side-by-side assessment.
- **4. Ability:** Meeting hubs (*Mäepepe*, *Mustika*, *Kristiine*) remove uncertainty over where lessons begin.
- **5. Timing:** Real-time slot chips (**< Vaba aeg: Täna 18:30**) create genuine urgency without manipulative countdowns.
- **6. Execution:** A streamlined modal captures only name, phone, and meeting preference, detailing required paperwork (ID card + driving book) on the completion screen.

3. Comparative Architecture: Before vs. After

Interface Element	Baseline Version (Before)	Behavioral Redesign (After)	Framework Alignment
Legal Status (T-kaart)	Passive text warning buried in the header.	Interactive banner with modal explanation and mandatory verification step.	CREATE: Cue & Thinking Spectrum (System 2)
Primary Card Action	Single impulsive button (Broneeri sõit).	Dual-action pair: Profiil (research) + Broneeri sõit (conversion).	Thinking Spectrum (Calibrated Friction)
Credibility & Proof	Instructor names without verified metrics.	Granular rating, review tally, and official exam pass rate (% esimesel katsel).	Fogg: Motivation
Availability Trigger	Completely invisible prior to profile navigation.	High-contrast next-slot pill (Vaba aeg: Reede 11:00) on card face.	Fogg: Prompt & CREATE: Timing
Vehicle Safety	Ambient tags without safety distinction.	Dedicated green/slate pill specifying dual pedals vs. personal vehicle.	Thinking Spectrum (Hazard Salience)
Booking Funnel	Redirect to full profile or undefined checkout.	Two-step modal with local meeting points and clear cash/transfer terms.	CREATE: Ability & Execution

4. Key Takeaways for Product Designers

- **Match Friction to Risk:** Low friction is desirable for low-stakes tasks, but high-stakes actions require informative, reassuring friction to prevent decision paralysis and safety oversights.

- **Trust Requires Proof Over Claims:** Generic statements like "*Experienced instructor*" fail to convert; concrete metrics such as pass rates and total practice hours ground user confidence in verifiable facts.
- **Reduce Timing Ambiguity:** Displaying the exact next slot turns passive browsers into active bookers by removing the scheduling guessing game.
